

Conditional Normalizing Flow for Fast Generation of MC SMEFT Events

A case study on $t\bar{t}Z$ data generation conditioned on Wilson coefficient c_{Ht}

- 4 Results
- 5 Conclusion

Outline

- 1 Introduction
- 2 Idea
- 3 Setup
- 4 Results
- 5 Conclusion

- Current MC simulation slow
- Need for fast generation of events
- Potential of normalizing flows
- Method widely applicable to other processes and parameters

Motivation: MC simulation slow

- In 2017 20% of the ATLAS computing resources were used for MC simulation [1]
- Current MC generation can take days or weeks for complex processes
- With the HL-LHC, more complex events and more data will require even more MC simulation
- We need faster and more efficient MC generation

Outline

- 1 Introduction
- 2 Idea
- 3 Setup
- 4 Results
- 5 Conclusion

- Take already existing MC data
- Train a conditional normalizing flow to learn the distribution of events
- Condition the flow on a Wilson coefficient
- Use the trained flow to generate new events for any value of the Wilson coefficient, much faster than traditional MC simulation

- 5 Conclusion

Normalizing flow: MAFMADEMOG

- Masked Autoregressive Flow (MAF)
 - A type of normalizing flow that models complex distributions by transforming a simple base distribution through a series of invertible transformations
- MADE (Masked Autoencoder for Distribution Estimation)
 - A type of autoregressive model that allows for efficient sampling and density estimation
- MOG (Mixture of Gaussians)
 - Used as the base distribution for the flow, allowing it to model complex distributions

Equation Example

$$p(x \mid \theta) = \frac{1}{Z(\theta)} \exp(-E(x; \theta))$$
